Reporting on Virtual Patient Type Activities from systems that do not support the standard

An educational group has 'constructed' their own homegrown virtual patient system in isolation from the standard e.g. a simple mobile app. At a later date the group becomes aware of the standard but do not see a business case to change their application. However they do wish to export the usage data from their application into common format that allows different virtual patient styles to be analysed and compared. Assuming they can map enough of the activities that occur in their application then they will be able to report a Learners activities using a virtual patient profile into a common Learning Record System.
