

Proposed modifications, references and learning resource type

The following modifications to healthcare lom were proposed April 16, 2014.

1 Change the healthcare lom Resource type vocabulary to the one specified at Proposed Vocabulary for [learningResourceType](#)

2 Add a references element to healthcareEducation. This references element would allow one or more reference elements within it. The namespace would be used to infer the nature of the reference.

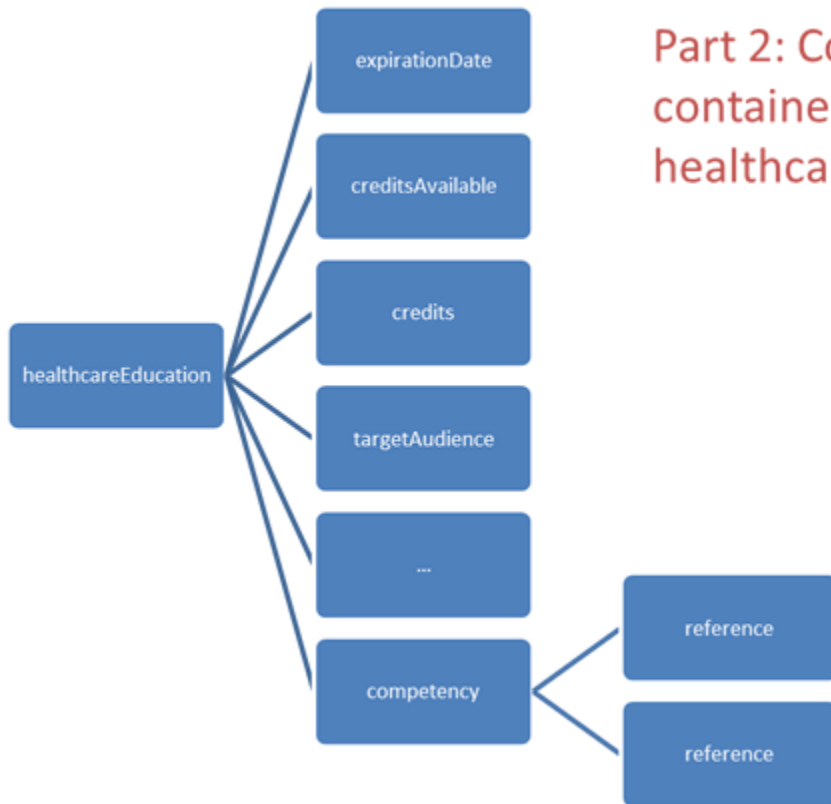

Example:

```
<references>
  <reference>
    <rdf:Description rdf:about="http://www.example.org/performanceguide2013.pdf"/>
    <dcterms:format>application/pdf</dcterms:format>
  </reference>
  <reference>
    <rdf:description about="http://www.example.org/milestone/IM_performanceframework.xml#sb04"/>
    <rdf:type rdf:resource="http://ns.medbiq.org/performanceframework/v1/" />
  </reference>
</references>
```

3. Add a competency element to healthcareEducation. The competency element would contain 2 references: one to the competency object and one to the relevant competency framework. the competency element would be repeatable to allow activities/content to reference more than one competency.

Part 2: Competency container within healthcareEducation

Example:

```
<competency>
  <reference>
    <rdf:description about="http://www.example.org/milestone/SBP4.xml"/>
    <rdf:type rdf:resource="http://ns.medbiq.org/competencyobject/v1"/>
  </reference>
  <reference>
    <rdf:description about="http://www.example.org/im_milestones.xml"/>
    <rdf:type rdf:resource="http://ns.medbiq.org/competencyframework/v1"/>
    <dcterms:format>application/xml</dcterms:format>
  </reference>
</competency>
```
